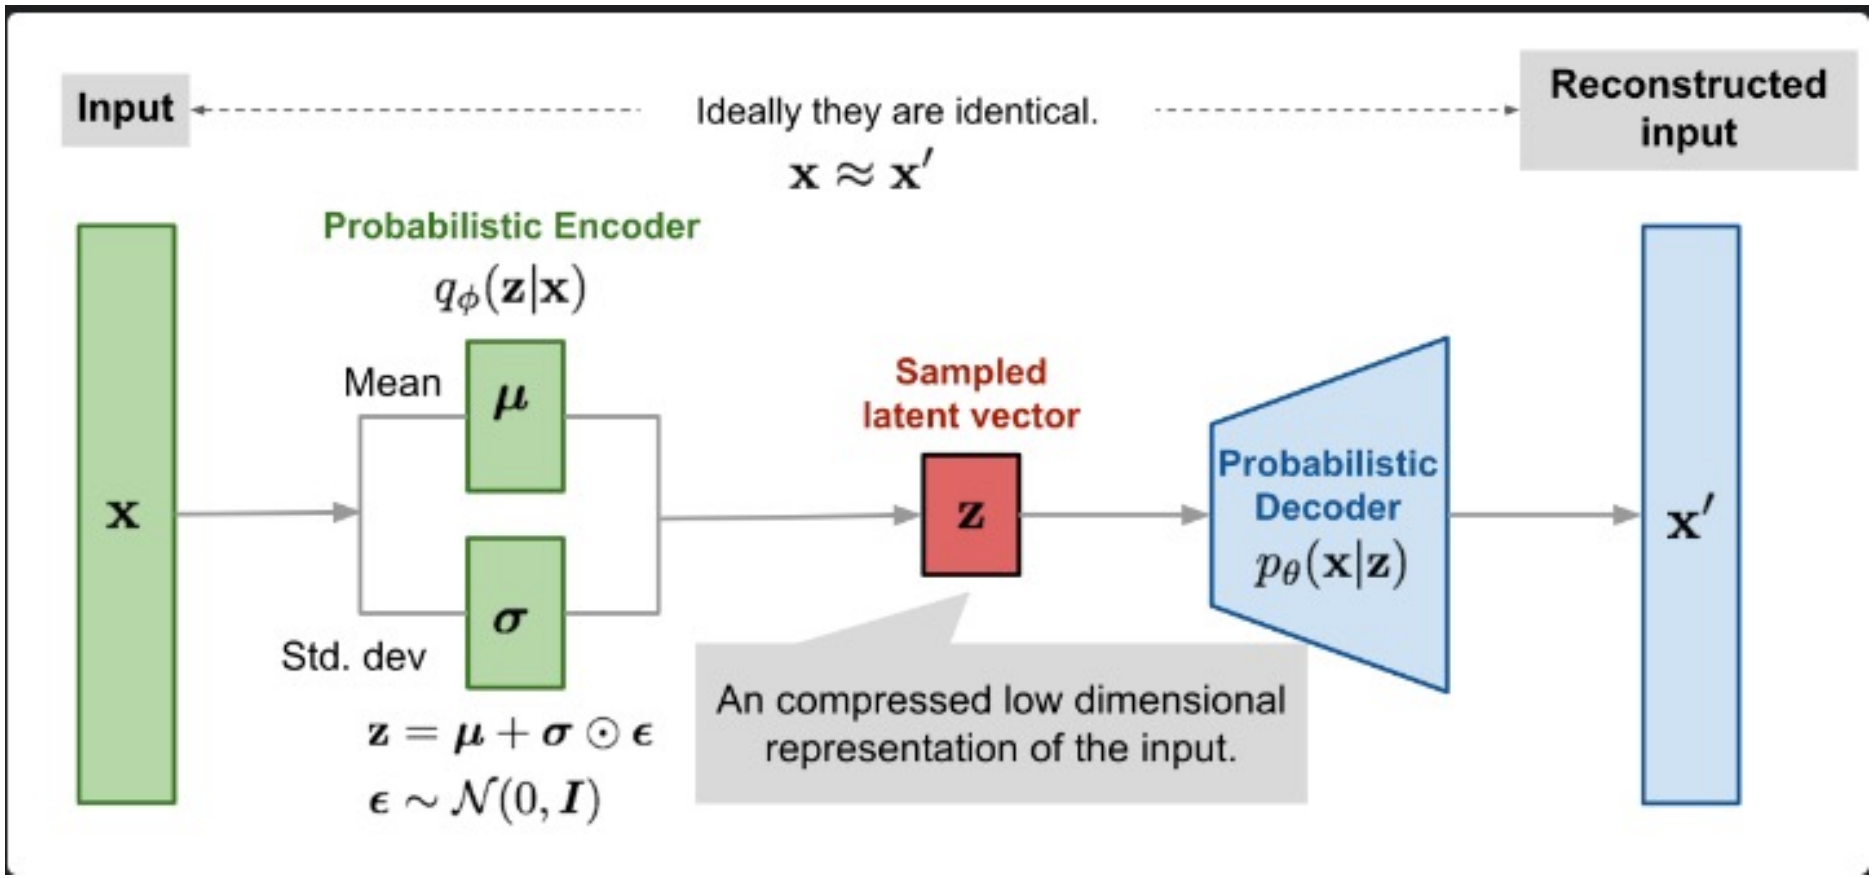
VAE



Input
Ideally they are identical.
$\mathbf{x} \approx \mathbf{x}'$
Reconstructed input
Probabilistic Encoder
$q_\phi(\mathbf{z}|\mathbf{x})$
Mean
$\boldsymbol{\mu}$
Std. dev
$\boldsymbol{\sigma}$
$\mathbf{z} = \boldsymbol{\mu} + \boldsymbol{\sigma} \odot \boldsymbol{\epsilon}$
$\boldsymbol{\epsilon} \sim \mathcal{N}(0, \boldsymbol{I})$
$\mathbf{x}$
Sampled latent vector
$\mathbf{z}$
An compressed low dimensional representation of the input.
Probabilistic Decoder
$p_\theta(\mathbf{x}|\mathbf{z})$
$\mathbf{x}'$

What is Variational AutoEncoder?

VAE is an autoencoder whose encodings distribution is regularised during the training in order to ensure that its latent space has good properties allowing us to generate some new data. A variational autoencoder (VAE) provides a probabilistic manner for describing an observation in latent space.

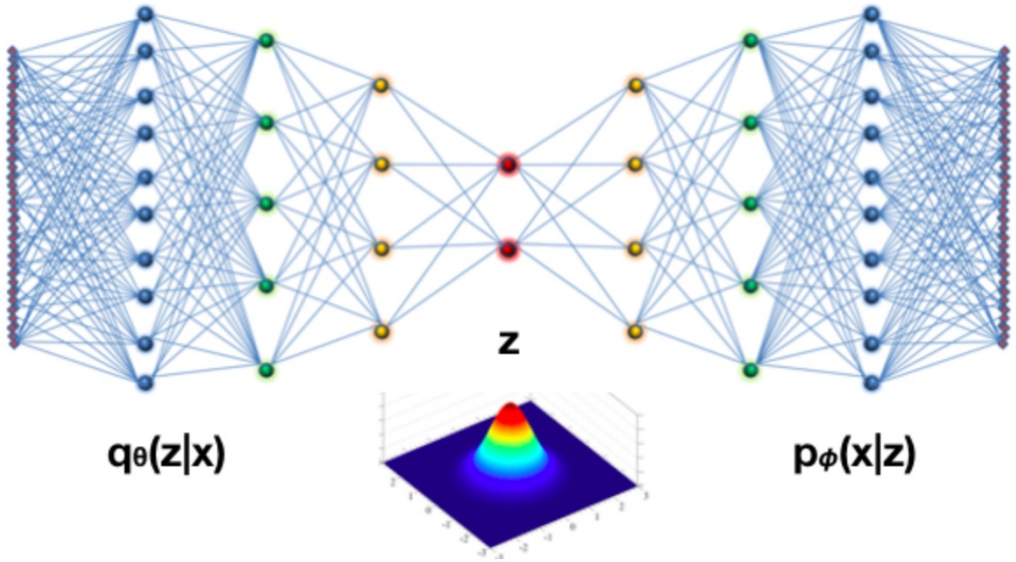

Figure 2: VAE

$$\min KL\left(q\left(z|x\right)||p\left(z|x\right)\right)$$

$$E_{q(z|x)}\log p\left(x|z\right) - KL\left(q\left(z|x\right)||p\left(z\right)\right)$$

The KL divergence between the approximate and the real posterior distributions is given by,

$$D_{KL}\left(q_\theta(z|x_i)||p(z|x_i)\right) = -\int q_\theta(z|x_i)\log\left(\frac{p(z|x_i)}{q_\theta(z|x_i)}\right)dz \geq 0$$
